## 1 R290 M thermal Mono System

### 1.1 System Schematic

R290 M thermal is an integrated air to water heat pump system and a one-stop solution for space heating, space cooling and domestic hot water. The outdoor heat pump system extracts heat from the outdoor air and transfers this heat through refrigerant piping to the plate heat exchanger in the hydronic system. The heated water in the hydronic system circulates to low temperature heat emitters (floor heating loops or low temperature radiators) to provide space heating, and to the domestic hot water tank to provide domestic hot water. The 4-way valve in the outdoor unit can reverse the refrigerant cycle so that the hydronic system can provide chilled water for cooling by fan coil units.

The heating capacity of heat pumps decreases as the ambient temperature drops. R290 M thermal Mono can be equipped with a backup electric heater to provide additional heating capacity for use during extremely cold weather when the heat pump capacity alone is insufficient. The backup electric heater serves as a secondary heat source in the event of a heat pump malfunction and also prevents the external water pipes from freezing during winter.

## 1.2 System Configurations

R290 M thermal Mono can be configured to run with the electric heater either enabled or disabled and can also be used in conjunction with an auxiliary heat source such as a boiler.

The chosen configuration affects the size of heat pump required. Three typical configurations are described below.

### Configuration 1: Heat pump only

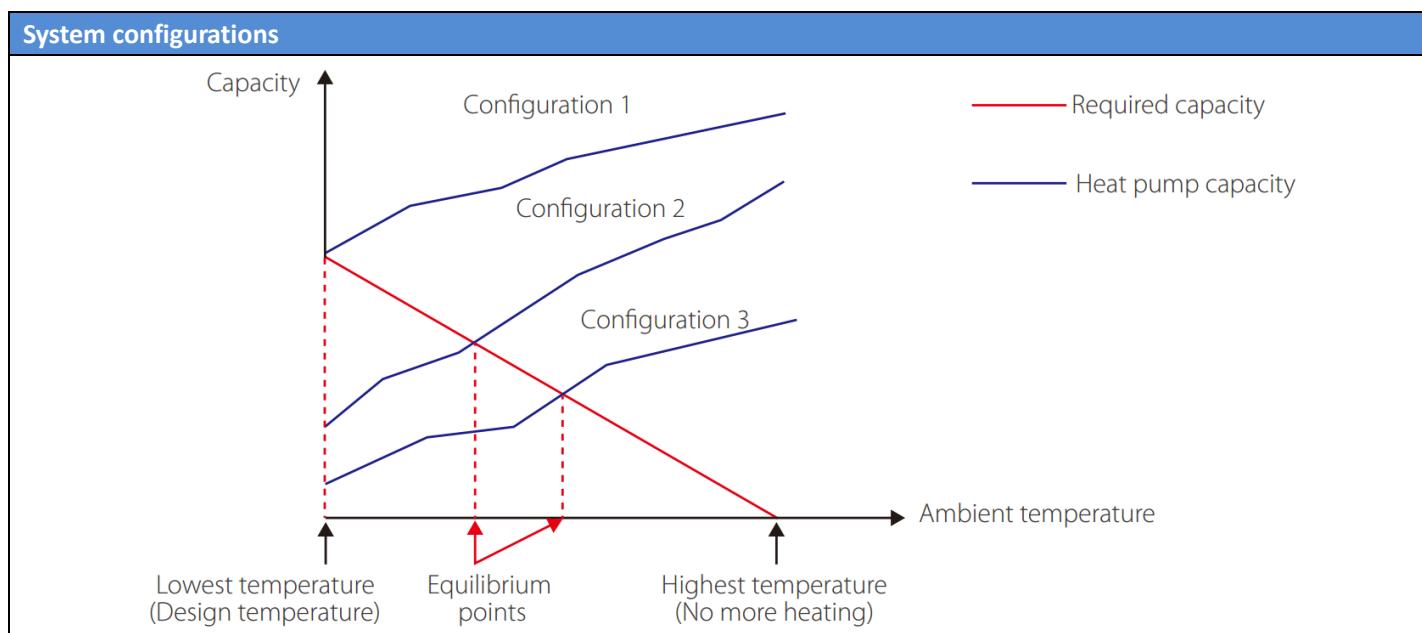

- The heat pump covers the required capacity with no additional heating capacity required.
- Requiring larger capacity heat pump implies higher initial investment in most cases.
- Ideal for new construction or other projects where energy efficiency is paramount.

### Configuration 2: Heat pump and backup electric heater

- Heat pump provides required capacity until ambient temperature drops below the point at which the heat pump alone is sufficient. At this point, the backup electric heater engages to cover the heating capacity shortfall. (see diagram below)
- Optimal balance between initial investment and operating costs, ensuring lowest cost of ownership.
- Ideal for new construction.

### Configuration 3: Heat pump with auxiliary heat source

- Heat pump provides required capacity until ambient temperature drops below the point at which the heat pump alone is sufficient. In such cases, the auxiliary heat source either provides the necessary supplemental heating capacity or takes over for the heat pump, depending on the system settings. (see diagram below)
- Enables selection of lower capacity heat pump.
- Ideal for remodeling and upgrades.

## 4 System Design and Unit Selection

### 4.1 Selection Procedure

#### Step 1: Total heat load calculation

Calculate conditioned surface area.  
Select the heat emitters (type, quantity, water temperature and heat load).

#### Step 2: System configuration

Decide whether to include AHS and set AHS's switching temperature.  
Decide whether backup electric heater is enabled or disabled.

#### Step 3: Selection of outdoor units

Determine required total heat load on outdoor units.  
Set capacity safety factor.  
Select power supply.

Provisionally select R290 M thermal Mono unit capacity based on nominal capacity.

Adjust capacity of the outdoor units for the following items:  
Outdoor air temperature / Outdoor humidity / Water outlet temperature<sup>1</sup> / Altitude / Anti-freeze fluid.

Is corrected R290 M thermal Mono unit capacity ≥ Required total heat load on outdoor units.<sup>2</sup>

Yes

R290 M thermal Mono system selection is complete

No

Select a larger model or enable backup electric heater operation

#### Notes:

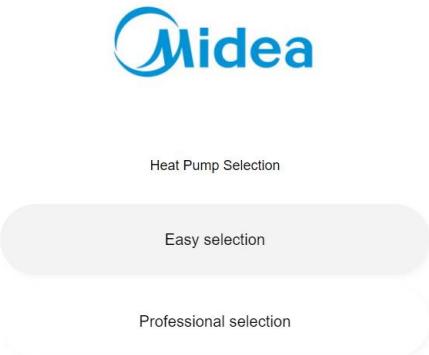

1. If the required water temperatures of the heat emitters are not all the same, the R290 M thermal Mono's outlet water temperature setting should be set at the highest of the heat emitter required water temperatures. If the water outlet design temperature falls between two temperatures listed in the outdoor unit's capacity table, calculate the corrected capacity by interpolation.
2. If the outdoor unit selection is to be based on total heating load and total cooling load, select Mono units which satisfy not only the total heating load requirements but also the total cooling load requirements.

## 4.2 Selection tool

Midea Heat pump selection website: <https://www.midea-hpselection.com>

Easy selection: For quick and simple unit selection without registration

Professional selection: For detailed and professional unit selection with registration and authorization.

## 4.3 R290 M thermal Leaving Water Temperature (LWT) Selection

The recommended LTW ranges for different types of heat emitters are as follows:

- For floor heating: 30 to 35°C
- For fan coil units: 30 to 45°C
- For low temperature radiators: 40 to 50°C

## 4.4 Optimizing System Design

To get the most comfort with the lowest energy consumption with Heat Pump, it is important to take account for the following:

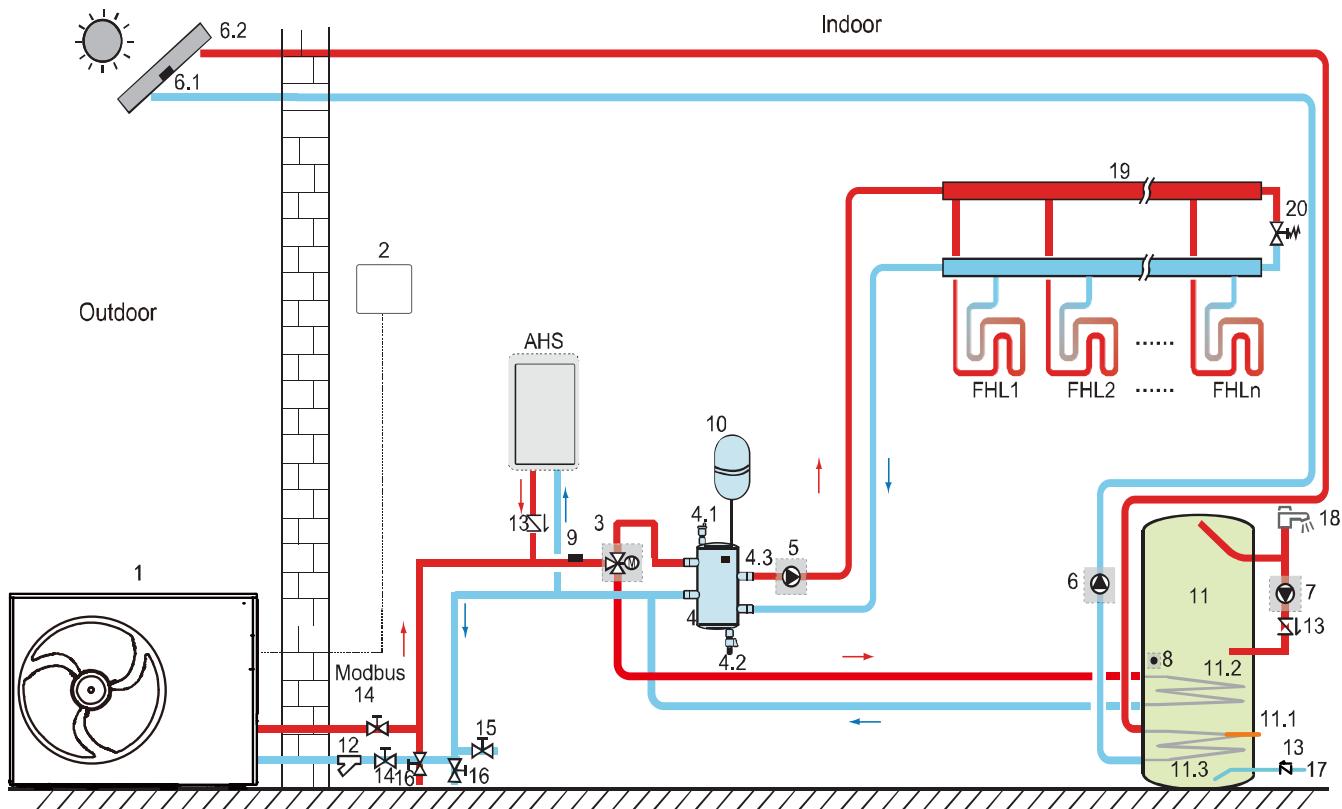

- Choose heat emitters that allow the heat pump system to operate at as low a hot water temperature as possible while still providing sufficient heating.
- Make sure the selected weather dependency curve matches the installation environment (building structure, climate) as well as end user's demands.
- Utilizing a room thermostat (supplied by user) to the hydronic system helps prevent excessive space heating by stopping the outdoor unit and circulation pump when the room temperature is above the thermostat set point.

## 5 Typical Applications

## Space heating

The ON/OFF signal, operation mode, and temperature are set on the user interface. P\_o keeps running as long as the unit is ON for space heating, while SV1 remains OFF.

## Domestic water heating

The ON/OFF signal and target tank water temperature (T5S) are set on the user interface. P\_o stops running as long as the unit is ON for domestic water heating while SV1 remains ON.

## AHS (auxiliary heat source) control

The AHS function is set on the HMI (for maintenance personnel).

- 1) When the AHS is set to be valid only for heating mode, AHS can be turned on in the following ways:
  - a. Turn on the AHS via BACKUP HEATER function on the user interface;
  - b. AHS will be turned on automatically if the initial water temperature is too low or the target water temperature is too high at low ambient temperature.

P\_o keeps running as long as the AHS is ON while SV1 remains OFF

- 2) The AHS is set to be valid for heating and DHW modes. In heating mode, AHS control is the same as item 1) listed above; In DHW mode, AHS will be turned on automatically when the initial domestic water temperature T5 is too low or the target domestic water temperature is too high at low ambient temperature. P\_o stops running while SV1 remains ON.
- 3) When the AHS is set to be valid, M1M2 can be set to be valid on the user interface. In heating mode, AHS will be turned on when the MIM2 dry contact closes. This function is invalid in DHW mode.

## TBH (tank booster heater) control

The TBH function is set on the user interface.

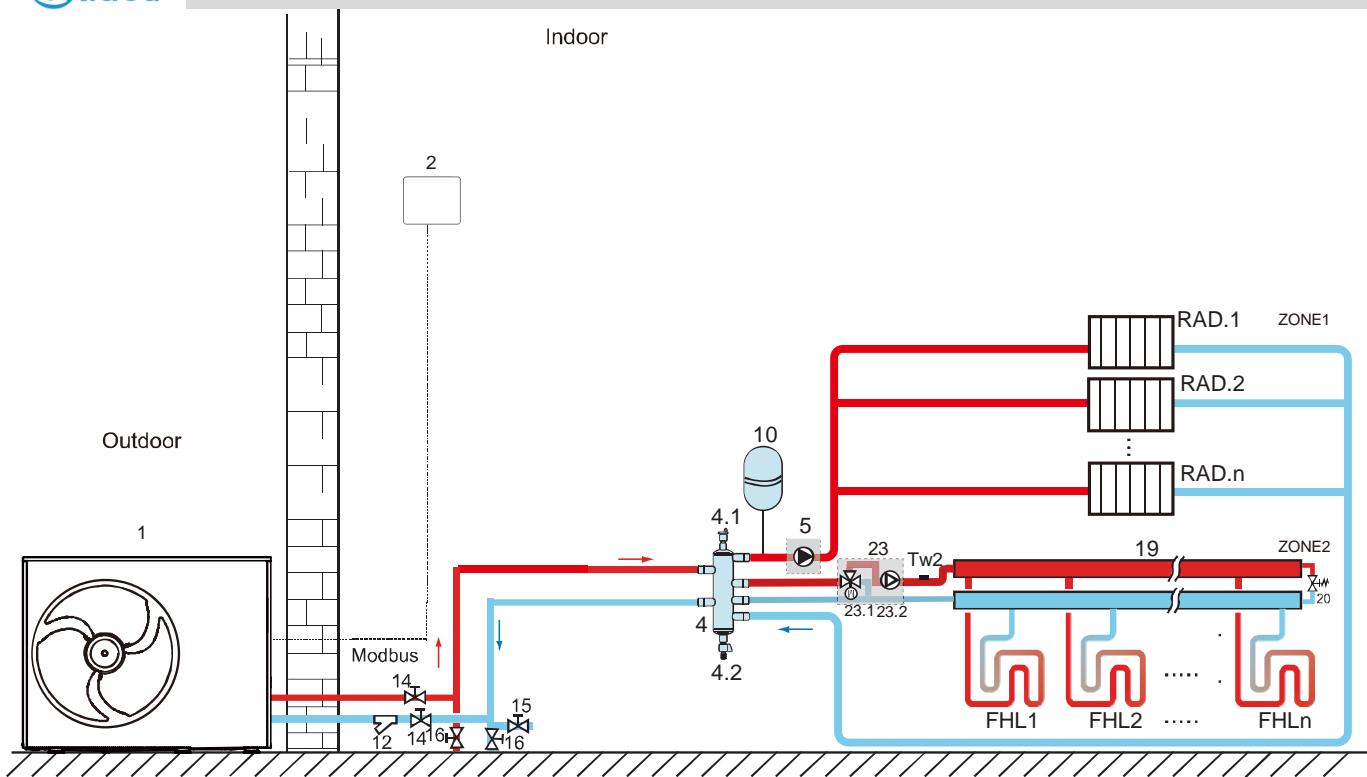

- 1) When the TBH is set to be valid, TBH can be turned on via TANK HEATER function on the user interface; In DHW mode, TBH will be turned on automatically when the initial domestic water temperature T5 is too low or the target domestic water temperature is too high at low ambient temperature.
- 2) When the TBH is set to be valid, M1M2 can be set to be valid on the user interface. TBH will be turned on when the MIM2 dry contact closes.

## Solar energy control

The unit recognizes solar energy signals by judging Tsolar or receiving SL1SL2 signals from the user interface. The recognition method can be set via *Solar function & Solar control* on the user interface. (The User interface >> For Serviceman >> Other heat source >> Solar function & Solar control).

- 1) When Tsolar is set to be valid, solar energy turns ON when Tsolar is high enough, and P\_s starts running; Solar energy turns OFF when Tsolar is low, and P\_s stops running.
- 2) When SL1 SL2 control is set to be valid, solar energy turns ON after receiving solar kit signals from the user interface, and P\_s starts running; If no solar kit signals are received, solar energy turns OFF, and P\_s stops running.

#### Notes:

- The example is just for application illustration; please confirm the exact installation method according to the installation manual.
- A bypass valve must be installed to make water recirculation possible when all shut-off valves are closed.

### Space heating

The ON/OFF signal, operation mode, and temperature are set on the user interface. Zone1 can operate in cooling mode or heating mode, while Zone 2 can only operate in heating mode; During operation, Zone1 is controlled by Final Water flow temperature (T1), Zone2 is controlled by Zone2 water outlet temperature(Tw2) or room temperature(Ta).

### Circulation pump operation

When Zone1 turns ON, P\_o starts running; When Zone1 turns OFF, P\_o stops running;

When Zone2 turns ON, SV3 switches between ON and OFF according to the set TW2, and P\_c remains ON; When Zone 2 turns OFF, SV3 remains OFF and P\_c stops running.

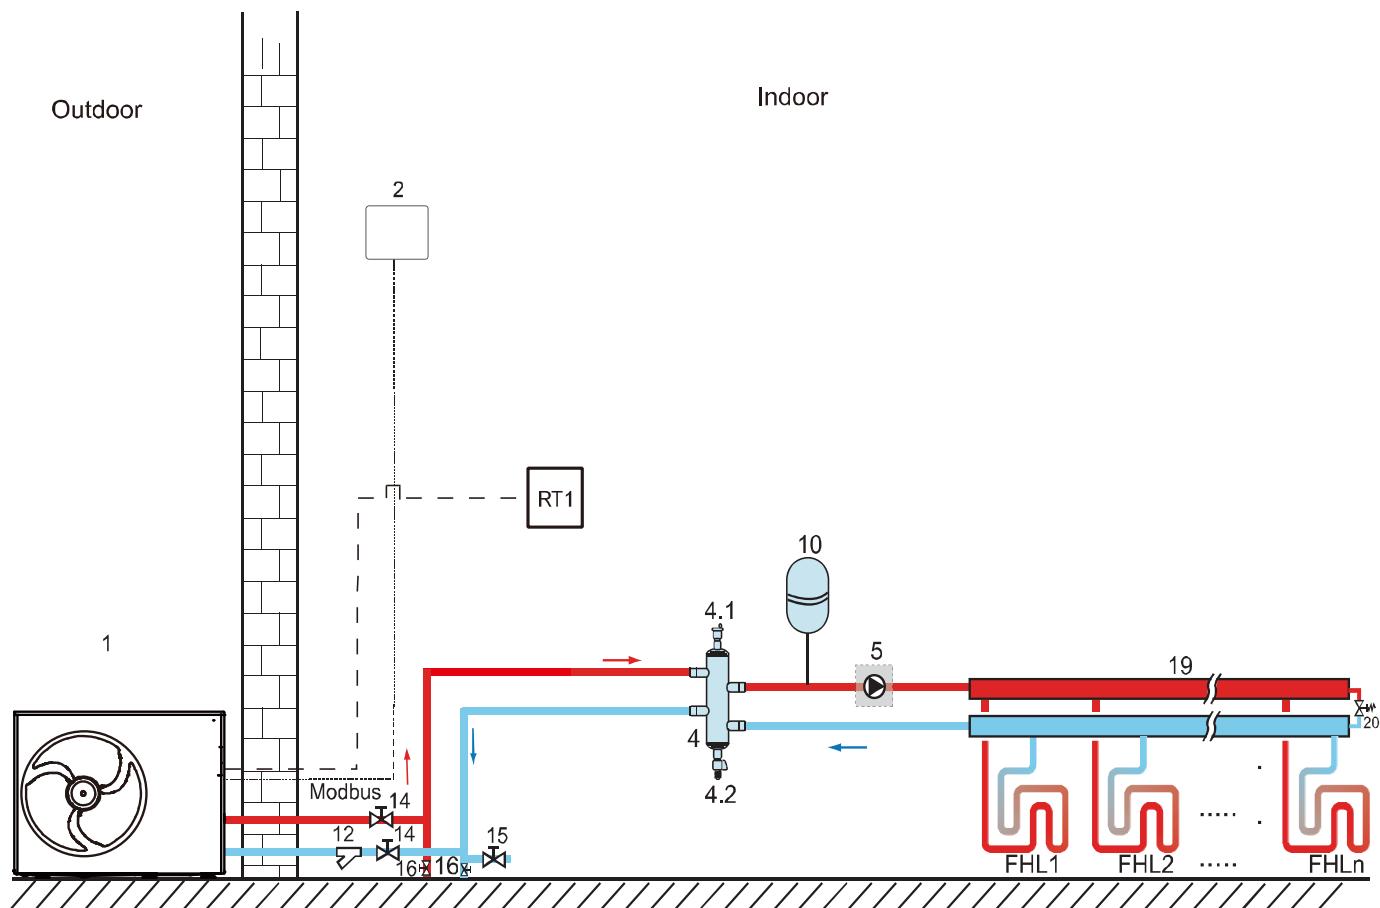

The floor heating loops require a lower water temperature in heating mode than radiators or fan coil units. To reach the set temperature points, a mixing station is used to adapt the water temperature according to requirements of the floor heating loops. The radiators are directly connected to the unit's water circuit and the floor heating loops and after the mixing station. The mixing station is controlled by the unit.

The domestic water tank, AHS (auxiliary heat source), TBH (water tank electric auxiliary heat), and solar control can be connected. The control method is the same as what is described in the above section.

## 5.2 Control through the user interface and room thermostat

Space heating or cooling control through the room thermostat needs to be set on the user interface. It can be controlled through mode setting, single-zone control or double-zone control. The monoblock can be connected to a low voltage room thermostat.

### Circulation pump operation

- 1) When the system is in cooling mode, which means "CL" of the thermostat closes, SV2 remains OFF while P\_o starts running.
- 2) When the system is in heating mode, which means "HT" close and "CL" open, SV2 remains ON while P\_o starts running.

The domestic water tank, AHS (auxiliary heat source), TBH (water tank electric auxiliary heat), and solar control can be connected. The control method is the same as what is described in the above section.

#### Notes:

- The example is just for application illustration; please confirm the exact installation method according to the installation manual.
- A bypass valve must be installed to make water recirculation possible when all shut-off valves are closed.

#### Space heating

Zone1 can operate in cooling mode or heating mode, while Zone 2 can only operate in heating mode; During installation, for thermostat in Zone1, only "HT" terminal need to be connected. For thermostat in Zone2, only "CL" terminals need to be connected.

1) The ON/OFF of Zone1 is controlled by the room thermostat there. When "HT" of thermostat in Zone1 closes, Zone 1 turns ON. When "HT" turn OFF, Zone 1 turns OFF; The target temperature and operation mode are set on the user interface.

2) In heating mode, the ON/OFF of Zone2 is controlled by the room thermostats there. When "CL" of temperature is set on the user interface; Zone 2 can only operate in heating mode. When cooling mode is set on the user interface, Zone2 remains OFF.

#### Circulation pump operation

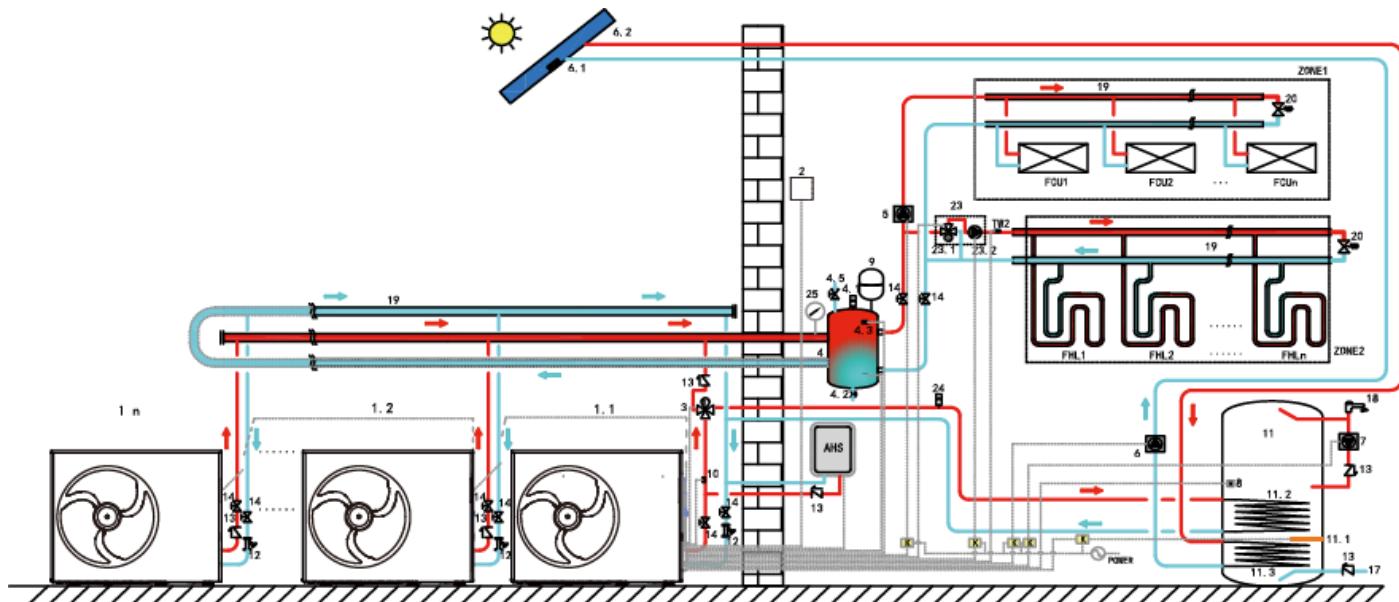

When Zone1 turns ON, P\_o starts running; When Zone1 turns OFF, P\_o stops running;

When Zone2 turns ON, SV3 switches between ON and OFF according to the set Tw2, and P\_c remains ON; When Zone 2 Turns OFF, SV3 remains OFF and P\_c stops running.

The floor heating loops require a lower water temperature in heating mode than radiators or fan coil units. To reach the set temperature points, a mixing station is used to adapt the water temperature according to requirements of the floor heating loops. The radiators are directly connected to the unit's water circuit and the floor heating loops and after the mixing station. The mixing station is controlled by the unit.

The domestic water tank, AHS (auxiliary heat source), TBH (water tank electric auxiliary heat), and solar control can be connected. The control method is the same as what is described in the above section.

## Domestic water heating

Only the master unit can operate in DHW mode. T5S is set on the user interface. In DHW mode, SV1 remains ON. When the master unit operates in DHW mode, the slave units can operate in space cooling/heating mode.

## Heating mode of slave units

All slave units can operate in space heating mode. The operation mode and temperature are set on the user interface. Due to changes of the outdoor temperature and the required load indoors, multiple outdoor units may operate at different time points.

In cooling mode, SV3 and P\_c remains OFF while P\_o remains ON.

In heating mode, when both Zone 1 and Zone 2 work, P\_c and P\_o remain ON, and SV3 switches

between ON and OFF according to the set TW2.

In heating mode, when only Zone 1 works, P\_o remains ON while SV3 and P\_c remain OFF.

In heating mode, when only Zone 2 works, P\_o remains OFF while P\_c remains ON, and SV3 switches between ON and OFF according to the set TW2.

### AHS (Auxiliary heat source) control

The AHS should be set via For serviceman mode on the user interface. The AHS is only controlled by the master unit. When the master unit operates in DHW mode, the AHS can only be used for producing domestic hot water; When the master unit operates in heating mode, the AHS can only operate in heating mode.

1) When the AHS is set to be valid only in heating mode, it will be turned on in the following conditions:

- a. The BACKUP HEATER function is enabled on user interface;
- b. The master unit operates in heating mode. When the inlet water temperature or ambient temperature is too low while the target leaving water temperature is too high, the AHS will be turned on automatically.

2) When the AHS is set to be valid in heating mode and DHW mode, it will be turned on in following conditions:

When the master unit operates in heating mode, conditions for turning on the AHS is same as 1); When the master unit operates in DHW mode, if T5 or the ambient temperature is too low while the target T5 temperature is too high, the AHS will be turned on automatically.

3) When the AHS is valid, the operation of the AHS is controlled by M1M2. When M1M2 closes, the AHS is turned on.

When the master unit operates in DHW mode, the AHS can not be turned on by closing M1 M2.

### TBH (Tank booster heater) control

The TBH should be set via For serviceman mode on the user interface. The TBH is only controlled by the master unit.

### Solar energy control

Solar energy is only controlled by the master unit.
